

PowerShell for Oracle DBAs

DOAG Conference + Exhibition
Andreas Jordan
September 22, 2022, Nuremberg

What can you expect here?

- A little HOW and a lot of WHY.
- My personal experiences.
- Highly simplified examples, as I do not have a realistic environment here.

Why PowerShell?

- Available on any Windows system, no installation required.
 - PowerShell 5.1 is currently sufficient and is included in Windows Server 2016 and Windows 10.
 - PowerShell 7 is certainly the future and also runs on Linux.
 - PowerShell ISE is sufficient as "development environment" and for the daily work.
 - Visual Studio Code (VS Code) can be useful for more extensive scripts.
- By using .NET, it is a full-fledged object-oriented programming language.
 - Loops
 - Error handling
 - Logging
- I can run my scripts line by line.

What requirements must be met?

➔ `odp.net \ managed \ common \ Oracle.ManagedDataAccess.dll`

- Probably already installed in many environments:
 - Oracle Database 19c Client (19.3) for Microsoft Windows x64 (64-bit)
 - <https://www.oracle.com/database/technologies/oracle19c-windows-downloads.html>
 - Starting with version 21c only NuGet packages are included.
- If download is possible:
 - NuGet package Oracle.ManagedDataAccess for PowerShell 5.1 on Windows
 - <https://www.nuget.org/packages/Oracle.ManagedDataAccess>
 - NuGet package Oracle.ManagedDataAccess.Core for PowerShell 7 on Windows and Linux
 - <https://www.nuget.org/packages/Oracle.ManagedDataAccess.Core>

How to use the DLL in PowerShell?

➔ `Add-Type -Path "...\\Oracle.ManagedDataAccess.dll"`

- This one line adds the .NET classes contained in the DLL to the PowerShell session.
- A few example classes:
 - `Oracle.ManagedDataAccess.Client.OracleConnection`
 - `Oracle.ManagedDataAccess.Client.OracleCommand`
 - `Oracle.ManagedDataAccess.Client.OracleDataAdapter`

Own commands as wrappers for the .NET classes

- Direct access to the .NET classes is possible, but the code becomes confusing.
- Custom commands interface between PowerShell code and .NET classes.
- I use:
 - Connect-OracleInstance
 - Invoke-OracleQuery

And now comes the demo...

```
$conString = "Data Source=...;User Id=...;Password=..."  
  
$connection = [Oracle.ManagedDataAccess.Client.OracleConnection]::new($conString)  
  
$connection.Open()
```

Invoke-OraQuery (I)

```
$command = $Connection.CreateCommand()  
$command.CommandText = $Query  
  
$dataAdapter = [Oracle.ManagedDataAccess.Client.OracleDataAdapter]::new()  
$dataAdapter.SelectCommand = $command  
  
$dataSet = [System.Data.DataSet]::new()  
  
$rowCount = $dataAdapter.Fill($dataSet)
```

Invoke-OraQuery (II)

```
switch ($As) {  
    'DataSet' {  
        $dataSet  
    }  
    'DataTable' {  
        $dataSet.Tables  
    }  
    'DataRow' {  
        if ($dataSet.Tables.Count -ne 0) {  
            $dataSet.Tables[0].Rows  
        }  
    }  
}
```

Invoke-OraQuery (III)

```
switch ($As) {  
    'PSObject' {  
        if ($dataSet.Tables.Count -ne 0) {  
            foreach ($row in $dataSet.Tables[0].Rows) {  
                [DBNullScrubber]::DataRowToPSObject($row)  
            }  
        }  
    }  
  
    'SingleValue' {  
        if ($dataSet.Tables.Count -ne 0) {  
            $firstColumn = $dataSet.Tables[0].Columns[0].ColumnName  
            $dataSet.Tables[0].Rows | Select-Object -ExpandProperty $firstColumn  
        }  
    }  
}
```

Loops, Error handling, Logging

- Loops:
 - `foreach ($table in $selectedTables) { Invoke-OraQuery ... }`
 - Display of a status bar helps to answer the question: When is the process finished?
 - Individual processing for the development or analysis of errors possible.
- Error handling:
 - `try { Invoke-OraQuery ... } catch { Write-Warning "Failure: $_" }`
- Logging:
 - I use: <https://psframework.org/> by Friedrich Weinmann (Microsoft employee)
 - `Write-PSFMessage -Level Host -Message "Starting Script..."`

And now comes the demo...

Excel as a popular data presentation program (I)

I use ImportExcel by Doug Finke (<https://github.com/dfinke/ImportExcel>).

The module does not require Excel to be installed, but brings its own .NET classes with it.

```
Install-Module -Name ImportExcel -Scope CurrentUser
Import-Module -Name ImportExcel

$query = 'SELECT * FROM v$parameter'
$data = Invoke-OraQuery -Connection $connection -Query $query

$excelParams = @{
    Path           = 'parameter.xlsx'
    WorksheetName = 'v$parameter'
    TableStyle     = 'Light18'
    AutoSize       = $true
    FreezeTopRow   = $true
}
$data | Export-Excel @excelParams
```

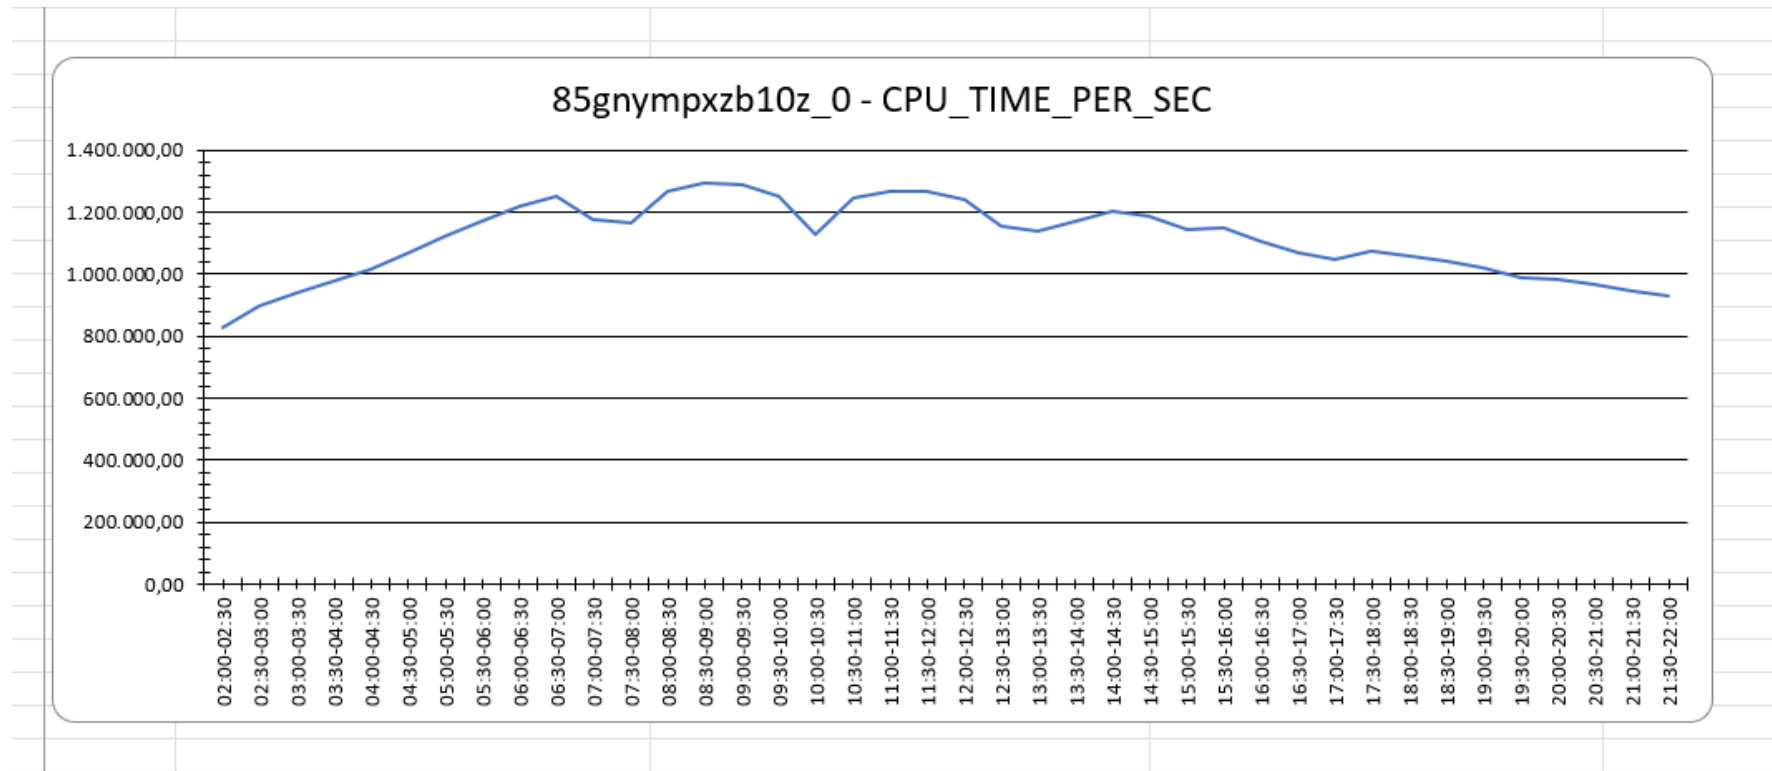

Excel as a popular data presentation program (II)

Excel as a popular data presentation program (IV)

What else could I talk about?

- Storage of data in JSON format
- Processing CLOBs
- Using bind variables
- PowerShell as an ETL tool
- ...

 **PowerShell offers many possibilities.**
